

DS 500 PM mobile – efficiency measurement for compressors

All-in-one measurement: electrical energy, pressure, dew point, temperature and consumption

Besides common measurements such as compressed air consumption or humidity, even more complex measurement tasks can be tackled with this all-round mobile device. With the DS 500 PM mobile, conducting an energy analysis according to DIN ISO 50001 is simple.

Its clear, simple operating method makes it possible, for example, to carry out an analysis of compressed air costs by simultaneously measuring energy consumption (kW/kWh) and compressor output (m³/m³/h). And the data logger with its integrated effective power meter is perfect for auditors or service technicians.

- Pressure [psi]
- Temperature [° C/°F]
- Residual oil content [mg/m³]
- Particle content [Cts/m³]

With one or more additional electricity/effective power meters, it is possible to carry out efficiency measurements of several compressors simultaneously.

Chart recorder / Logger

Analysis of specific power:

By measuring power consumption and delivery volume simultaneously, it is possible to calculate the specific power of the compressor. The specific power is calculated using the ratio of the required energy consumption in kWh to the volume of air in CF output during the same period.

$$\text{Specific power} = \frac{\text{kWh}}{\text{CF}}$$

The specific performance indicator of the compressor supplies information about the compressor's characteristics. The "to" graphic below can be used as an aid to assessment:

Typical specific power requirement for an oil-injected compressor

Delivery volume: 43.7 Nm³/min
(according to ISO 1217 based on 20° C + 1 bar)

Total power consumption: 272.7 kW

Specific power requirement = 272.7 kW/43.7 m³/min
= 6.24 kW/m³/min
= 0.104 kWh/m³
